

Paternalism: Own-Provider vs Cross-Edit (edit-level, 95% CI)

Mean paternalism score per edit
(-) idealized imposed (+) stated honored

own-provider vs cross-edit. n = individual edits. Per-edit score: +1 per conflict resolved toward the positive pole, -1 toward the negative pole.
Error bars: 95% CI of the mean ($\pm 1.96 \cdot s/\sqrt{n}$), which understates true uncertainty since edits within a chain are correlated.
